

What is the #1 most important service?

If you chose "EXAM", you're right! Don't get us wrong... vaccines, tests, & parasite prevention are important. But many diseases & problems don't have a vaccine, & some don't cause symptoms until it's too late. Regular physical exams are the only way to detect, diagnose, & treat issues like diabetes, heart disease, kidney failure, thyroid disorders, & more. So make sure we examine your dog every 6 months, even if no vaccines or tests are due.

Basic Puppy Wellness Plan

These are the basic health services we recommend to provide your dog with a quality life and to minimize the risk of disease that can be prevented through vaccinations, blood tests, deworming, spaying/neutering, and regular physical examinations.

This plan does not cover illnesses.

It covers healthy, preventative services only.

***** For optimum effect, all included services must be used within 6 months of your puppy's date of birth.***

All included discounts expire one year from purchase.

Puppies and Dogs

DAP = Distemper, Adenovirus, Parvovirus and Parainfluenza

Distemper is so wide-spread nearly every dog will be exposed during its lifetime. Distemper's high death rate makes vaccination a must. Dogs with distemper may suffer coughing, vomiting, diarrhea and other symptoms followed by death.

Adenovirus Causes Hepatitis which affects the dog's liver. It spreads through an infected dog's urine, & exposure can result in anything from a mild infection to death.

Parvovirus is an intestinal viral infection resulting in diarrhea, fever, vomiting and severe depression. Transmitted through contact with an infected dog's feces, Parvo is highly contagious and life-threatening, especially in puppies.

Leptospirosis is a bacterial disease that infects dogs AND humans. It mainly affects the liver & kidneys, causing vomiting, kidney failure, & can be deadly. Due to increasing prevalence, we use a 4-way vaccine that protects against multiple strains, unlike older vaccines that only cover one or two varieties.

Heartworm Disease is life threatening wherever mosquitoes are present. Adult dogs must be tested prior to starting preventative medication. Use of preventatives in an infected dog could result in death. Annual testing is needed even if treating year-round with preventative medication. Preventative medication is a must!

Rabies is a fatal infection of the nervous system that attacks all warm-blooded animals including humans. It is a public health hazard and risk to all pet owners. There is no cure for Rabies. Vaccination is your pet's only protection and is required by law.

Bordetella and Parainfluenza can cause Kennel Cough, an upper respiratory infection with a persistent, dry, hacking cough. The disease may last several weeks and is extremely contagious.

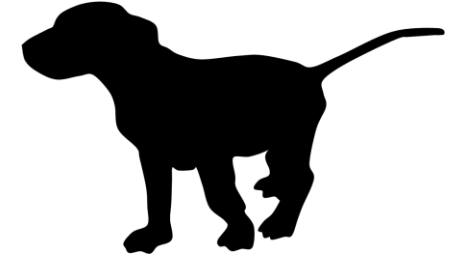

Intestinal Parasites threaten your pet's health. In large numbers, they can cause intestinal blockages, bloody diarrhea & even premature death. Microscopic examinations of your pet's stool should be done every 6 months for early detection and treatment. Some intestinal parasites can be transmitted to humans.

Spaying (female) or Neutering (male) is recommended for all pets that are not intended for breeding or showing. In addition to preventing pregnancy, spay/neuter surgery significantly reduce the possibility of breast tumors, testicular disease, cancer and certain undesirable behaviors (aggression, wandering, etc.). While spay/neuter surgery is recommended when your pet is about six months old, it can usually be done at any age.

Fleas can cause anemia and even death in young pets. If swallowed, fleas can transmit tapeworms to your pet. Flea bites can cause allergic reactions resulting in a painful, itchy skin disease. Your veterinarian is best qualified to prescribe the proper products for you to eliminate these parasites.

Puppy Wellness

Plan 2021

Our Puppy Wellness Plan is a comprehensive preventive health maintenance plan for your dog. As a new pet owner, you need to be aware of your veterinarian's recommendations regarding:

- **Your dog's physical examination**
- **Vaccinations your dog should receive**
- **Blood tests which should be performed to rule out existing disease**
- **Testing for internal parasites**
- **Deworming**
- **Diet and nutrition**
- **Housebreaking and training**
